

## Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact [support@jstor.org](mailto:support@jstor.org).

cyclonic movements in New England; 2. \$150 to Samuel Rideal, Esq., of University college, London, England, for investigations on the absorption of heat by odorous gases; 3. \$75, to H. M. Howe, Esq., of Boston, Mass., for the investigation of fusible slags of copper and lead smelting; 4. \$500 to Prof. J. Rosenthal of Erlangen, Germany, for investigations on animal heat in health and disease; 5. \$50 to Joseph Jastrow, Esq., of the Johns Hopkins university, Baltimore, Md., for investigations on the laws of psychophysics. The board of trustees consists of H. P. Bowditch, president; William Minot, jun., treasurer; Francis A. Walker; Edward C. Pickering; Charles Sedgwick Minot, secretary.

—The fish-commission schooner *Grampus*, recently finished, has been engaged during the winter in catching cod-fish and gathering cod-eggs, and also in catching mackerel. It is the purpose of the commission to study the migrations of the mackerel from its first appearance until it enters the Gulf of Maine. The seasons and conditions favorable to spawning will be closely observed. The migrations of menhaden, blue-fish, and other fishes, will also be studied.

—The conference of astronomers called by Admiral Mouchez, director of the Paris observatory, for the purpose of forming a plan of co-operation in photographing the whole sky, will doubtless result in the accomplishment of this project. The proposition is to enlist ten or twelve observatories in the undertaking, so located that their combined range will take in the whole sky. It is suggested that each plate be four degrees square, which if adopted, would require eleven thousand plates. It is estimated, that, with an average of one hundred plates per year from eleven observatories, each plate covering four degrees square, it would take ten years to complete the whole work.

—We learn from the *Athenaeum* that the Hibbert lecturer this year will be Professor Sayce, and the subject will be Assyrian and Babylonian religion. The lectures will be delivered at the end of April and during May, both in London and Oxford. The Hibbert trustees have also in the press a work by one of their scholars, Mr. H. W. Wallis of Cambridge, 'On the cosmology of the Rig Veda: a study in Indian logic.'

—Rev. W. Lucas Collins, editor of the popular series of 'Ancient classics for English readers,' is dead.

—Professor Möbius of Kiel is the new director of the Zoological museum at Berlin.

—Messrs. B. Westermann & Co., New York, have published a second edition of Lemcke's "An

illustrated grammar of skat, the famous German game of cards now attracting so much attention."

—Entrance examinations for the Massachusetts institute of technology will be held in Boston, Mass., on Thursday and Friday, June 2 and 3; also in New York, Philadelphia, Montreal, Chicago, St. Louis, Cincinnati, San Francisco, Washington, Nashville, St. Paul, Atlanta, and Pittsburgh.

—The *Lancet* reports the case of a woman dying from myxedema whose temperature ranged from 66° F. to 76° F., the normal temperature being 98.5° F. The pulsations of this patient's heart were 36, and her respirations 12 to the minute. The temperature is said to be the lowest human temperature on record.

—The *New York medical journal* of April 9 contains a detailed account, with illustrations, of the induction balance and the telephonic probe employed for the detection and location of metallic masses in the human body.

—The *Boston medical and surgical journal* reports that a large number of calves from one hour to three days old are said to have been slaughtered in Herkimer and Oneida counties, and sent to New York, where they are put up as 'canned chicken.'

—From the report of the hospital for Chinese, in Shanghai, we learn that in China small-pox inoculation is still in vogue. For this purpose a rag is moistened with the variolous matter and placed in the nostril. That the disease is prevalent in China is easily understood after this explanation.

#### LETTERS TO THE EDITOR.

\* \* \* The attention of scientific men is called to the advantages of the correspondence columns of SCIENCE for placing promptly on record brief preliminary notices of their investigations. Twenty copies of the number containing his communication will be furnished free to any correspondent on request.

The editor will be glad to publish any queries consonant with the character of the journal.

Correspondents are requested to be as brief as possible. The writer's name is in all cases required as proof of good faith.

#### Mole-lore.

HERE are three items of mole lore in the District of Columbia:—

1. A mole's feet cut off and hung around a child's neck will help it in teething. In some instances in Virginia these odd amulets have been handed down, I am told, for generations. They are equally believed in by colored people of Maryland. 'That's what the old-time people say,' is the only explanation. The superstition comes into the District from both these neighboring states.

2. Once the mole was an over-proud young lady. She is condemned to travel under ground as a punishment for her pride. Unlike the former, this is told with a smile, and probably quite without belief.

It will be readily recognized as a myth of wide dispersion. Perhaps the delicate fur and the grovelling habits of the little animal account for it.

3. Once the mole had eyes like other animals, but no tail. He met a creature which ridiculed him for his poverty in this latter respect. The derision preyed on his mind, and, when he met a being who could help him, he petitioned for aid. He was told that he must give up his eyesight. 'So he sold his eyes for his tail.'

W. H. BABCOCK.

Washington, D.C., April 16.

### Some hardy buds.

While in the country two weeks ago, my wife cut some branches from a pear and a cherry tree, and also from a lilac-bush, and brought them to the city. At that time the buds looked as they had all winter; in fact, we thought the pear cutting was dead. In a few days the buds commenced to open, and to-day the cherry-blossoms are out, as they would be on the tree, the blossoms of the pear are just opening, and those of the lilac are beginning to show. The water in which they were placed has been changed daily, and the cuttings kept in the sun as much as possible. It has occurred to us that such cuttings might be placed in rooms where there are invalids, both in homes and in hospitals, and give the sick a taste of the country which they could otherwise not get. It is no less an object of interest and instruction to the well: the daily, and I might say hourly, changes in the buds as they unfold are fascinating to watch, and even those whose lives have been spent in the country have never seen the gradual development of the blossoms as they can thus see them on the severed branches.

Brooklyn, April 8.

### On tiptoe.

While feeling honored that the attention of so eminent a physicist as Professor LeConte should be attracted to the question which has been recently discussed in *Science* under this heading, it still seems to me, as it did when I called the attention of Professor Van Dyck to the matter, that the lever is of the first order,

Professor LeConte quietly assumes that the point *C* (adopting his figure, *Science*, ix. p. 341) is the ful-

crum, but just there is the question. Suppose a person sitting down to put his toe against some object, and, by the same muscular action which raises the body on tiptoe, to push the object away. Here the case is evidently a lever of the first class, the ful-

crum being the ankle-joint (*B*), and the weight the point of the toe's pressure (*C*).

Now suppose, that, in precisely the same way, he presses his toe against some firmer object, as a wall, and, instead of pushing it, pushes *himself* away.

I fail to see how it is other than an unnecessary complication, at least from a physiological standpoint, to suppose the fulcrum and weight to change places, so as to make the lever one of the second class. Further, in cases where the result is partially a movement of the object, and partially of the person's body, — as in rising on tiptoe upon a yielding object, — the complication of the solution upon the hypothesis that the lever is of the second class is further increased; whereas in every case, since the foot still turns upon the ankle-joint *B*, by regarding it as a fulcrum and the lever as of the first class, the conclusion reached by Professor LeConte, that  $P:W :: CB:AB$ , becomes an evident application of the general law of mechanics.

EDWIN J. POND.

Austin, Tex., April 12.

### Winds in Denver.

H. A. Howe, in *Science*, No. 216, asks "why winds blow at Denver from the north during the day, and from the south at night."

It is for these reasons: Denver is in a cañon running north (the mountains on the west, a slight elevation on the east, and a 'divide' on the south), through which flows Cherry Creek. Now, winds *invariably* blow up cañons during the day, and down them at night. This brings the question to, "Why do winds blow up cañons during the day, and down at night?" which I take to be the intended interrogatory. During the day, the sun heats the air, which, becoming light, rushes up the cañons, while at night the air becomes cool and seeks lower altitudes. Of course, the disturbed equilibrium increases the wind's velocity. I think I have crudely answered the question.

Silver Reef, Utah, April 7.

### Geographical centre of the United States.

If an area or district of country is mapped on a projection of small areal distortion, the geographical centre of the area may be defined to be the centre of gravity of the figure.

The problem to determine the centre, would, under this definition, resolve itself into the question of determining the centre of gravity of a plane figure of irregular outline. Of the various ways in which the centre of such an area may be found, the mechanical ones are perhaps of easiest application, and, on the whole, yield the most satisfactory results.

One method consists in tracing the outline of the area whose centre is to be determined, on stiff cardboard, then cutting out the figure along the boundary so traced, and balancing the resulting cardboard on a point; which point so found is the point sought.

Another way consists in cutting out the map, as before, along the boundary-line, and then suspending it behind a plumb-line, so that map and plumb-line hang from the same support: the projection of the plumb-line on the map is a line which passes through the centre of gravity of the area. By suspending the map successively from several differ-
